

# Architecture Repository Bootstrap Instructions

## Objective

Create a clean, maintainable architecture repository scaffold for a new software system.

This repository will become the authoritative architecture source of truth for:

- Product
- Architecture
- Engineering
- Security
- Operations
- AI-assisted development tools

The purpose of this task is to create the repository structure and placeholder documents only.

Do not generate architecture.

Do not generate requirements.

Do not invent technologies.

Do not invent business rules.

Do not invent actors, systems, integrations, APIs, or deployment environments.

Do not create architecture content beyond placeholders and document structure.

The output should be a clean architecture repository ready for future population.

---

## Repository Structure

Create the following structure exactly:

```
.
├── README.md
├── .github/
│   ├── workflows/
│   │   └── ai-doc-linter.yml
├── architecture/
│   └── index.md
```

```
| | | context/
| | | | | business-context.md
| | | | | system-context.md
| | | | | actors-and-roles.md
| | | | | external-systems.md
| | | views/
| | | | | logical-view.md
| | | | | data-view.md
| | | | | integration-view.md
| | | | | deployment-view.md
| | | | | security-view.md
| | | systems/
| | | | | system-template/
| | | | | | index.md
| | | | | | components/
| | standards/
| | | technical-standards.md
| | | quality-attributes.md
| decisions/
| | 0001-record-architecture-decisions.md
| governance/
| | risks.md
| | assumptions.md
| | open-questions.md
| archive/
| | README.md
| | legacy-artifacts/
| glossary.md
```

## Global Documentation Rules

Every Markdown document must begin with:

```
# [Document Title]

## Document Status

Draft

## Purpose

<!-- AI_HINT: PENDING_DISCOVERY - DO NOT AUTOFILL -->
```

TBD

## Owner

<!-- AI\_HINT: PENDING\_DISCOVERY - DO NOT AUTOFILL -->

TBD

## Last Updated

TBD

Allowed Document Status values:

- Draft
- In Review
- Approved
- Deprecated

Document Status represents the lifecycle state of the document itself.

It does not represent architecture decision status.

---

## Placeholder Rules

Never use naked placeholder text.

Every incomplete section must use:

```
<!-- AI_HINT: PENDING_DISCOVERY - DO NOT AUTOFILL -->
```

TBD

This repository intentionally contains placeholders that must not be automatically completed by AI systems.

Missing information should remain unresolved until architecture discovery occurs.

---

## README.md

Create a detailed repository overview.

Include the following sections.

---

## Purpose

Explain that this repository is the authoritative architecture source of truth for the system.

---

## Audience

- Product
  - Architecture
  - Engineering
  - Security
  - Operations
  - AI-assisted development tools
- 

## Guiding Principles

- Documentation as Code
  - Architecture Before Implementation
  - Decisions Over Opinions
  - Explicit Boundaries
  - Single Authoritative Source
  - Glossary First Vocabulary
  - Archive Rather Than Delete
- 

## Repository Navigation

Provide descriptions for:

- architecture/
  - standards/
  - decisions/
  - governance/
  - archive/
  - glossary.md
-

## Source of Truth Rules

### Single Authoritative Source Rule

Each concept must have one authoritative location.

Do not define the same concept in multiple active documents.

Other documents should reference the authoritative definition rather than duplicate it.

---

### Glossary First Rule

Domain and technical vocabulary must be defined in `glossary.md` before being broadly used throughout the repository.

Examples:

- Customer
  - User
  - Account
  - Tenant
  - Facility
  - Unit
  - Reservation
  - Lease
  - Role
  - Permission
  - Scope
- 

### Relative Pathing Rule

All cross-document references must use explicit relative paths.

Examples:

```
[Technical Standards](../standards/technical-standards.md)
```

or

```
../../standards/technical-standards.md
```

Never use repository-root absolute paths.

Examples that should not be used:

```
/standards/technical-standards.md
```

Relative paths improve:

- local markdown rendering
  - repository portability
  - AI traversal
  - graph indexing
- 

## Archive Rule

Superseded, obsolete, experimental, or conflicting documents must be moved to:

```
archive/legacy-artifacts/
```

Do not maintain multiple active versions of the same concept.

Archived documents are historical references only.

Archived documents are not authoritative.

When a document is archived, update:

```
archive/README.md
```

with:

- file moved
  - archive date
  - reason
  - active replacement document
- 

## AI Usage Rule

AI-assisted tools must treat this repository as the architecture source of truth.

AI systems must not invent:

- requirements

- architecture
- actors
- integrations
- business rules
- technologies

When information is missing:

- leave placeholder markers intact
- create open questions
- do not autofill assumptions

---

## architecture/index.md

Create sections only.

Do not populate content.

Include:

- Architecture Overview
- Business Alignment
- System Landscape
- Domain Boundaries
- High-Level Architecture
- Related Documents

Each section should contain:

```
<!-- AI_HINT: PENDING_DISCOVERY - DO NOT AUTOFILL -->
```

TBD

---

## architecture/context/business-context.md

Create placeholders for:

- Business Objectives
- Success Metrics
- Stakeholders
- Constraints
- Assumptions

- Risks
- Out of Scope

Use AI placeholder markers.

---

## architecture/context/system-context.md

Create placeholders for:

- System Purpose
- System Responsibilities
- In Scope
- Explicit Non-Responsibilities
- External Dependencies
- High-Level Context Diagram

Use placeholder markers.

Include only this Mermaid placeholder:

```
flowchart TD
    A[Placeholder]
```

---

## architecture/context/actors-and-roles.md

Create placeholders for:

- Actors
- Responsibilities
- Role Definitions
- Permissions
- Security Scopes

Include:

| Actor | Responsibility | Role | Scope |
|-------|----------------|------|-------|
| TBD   | TBD            | TBD  | TBD   |

## architecture/context/external-systems.md

Create placeholders for:

- Upstream Systems
- Downstream Systems
- Third-Party Services
- Integration Responsibilities
- Ownership

Use placeholder tables.

---

## architecture/views/logical-view.md

Create placeholders for:

- Bounded Contexts
- Major Systems
- Containers
- Components
- Relationships

Include:

- > Not all architecture views require equal depth.
  - > Populate only when justified by architectural concerns.

Include Mermaid placeholder.

---

## architecture/views/data-view.md

Create placeholders for:

- Core Entities
- Data Ownership
- Data Lifecycle
- Data Classification
- Retention

Include architectural-depth guidance.

Include Mermaid placeholder.

---

## **architecture/views/integration-view.md**

Create placeholders for:

- APIs
- Events
- Message Flows
- Contracts
- Integration Patterns

Include architectural-depth guidance.

Include Mermaid placeholder.

---

## **architecture/views/deployment-view.md**

Create placeholders for:

- Environments
- Infrastructure
- Network Zones
- Runtime Components
- Scaling Considerations

Include architectural-depth guidance.

Include Mermaid placeholder.

---

## **architecture/views/security-view.md**

Create placeholders for:

- Authentication
- Authorization
- Encryption
- Secrets Management
- Audit Logging
- Threat Considerations
- Compliance Requirements

Include architectural-depth guidance.

Include Mermaid placeholder.

---

## architecture/systems/system-template/index.md

Create a reusable system template.

Include sections:

- Purpose
- Responsibilities
- In Scope
- Explicit Non-Responsibilities
- Dependencies
- Containers
- Related ADRs
- Risks
- Open Questions

Include:

| In Scope | Explicit Non-Responsibilities |
|----------|-------------------------------|
| TBD      | TBD                           |

All sections should contain AI placeholder markers.

Do not define a real system.

---

## standards/technical-standards.md

Create placeholders for:

- Coding Standards
- Logging Standards
- Error Handling
- API Standards
- Documentation Standards
- Testing Standards

Use AI placeholder markers.

---

## standards/quality-attributes.md

Create placeholders for:

- Availability
- Reliability
- Scalability
- Performance
- Security
- Maintainability
- Observability
- Compliance

Each section should contain:

- Objective
- Target Metrics
- Measurement Method

Do not split quality attributes into separate files.

---

## decisions/0001-record-architecture-decisions.md

Create an ADR template.

Use:

```
# ADR-0001: Record Architecture Decisions

## Document Status

Draft

## ADR Status

Proposed

## Context

<!-- AI_HINT: PENDING_DISCOVERY - DO NOT AUTOFILL -->

TBD

## Decision
```

```
<!-- AI_HINT: PENDING_DISCOVERY - DO NOT AUTOFILL -->
```

TBD

### ## Alternatives Considered

```
<!-- AI_HINT: PENDING_DISCOVERY - DO NOT AUTOFILL -->
```

TBD

### ## Consequences

```
<!-- AI_HINT: PENDING_DISCOVERY - DO NOT AUTOFILL -->
```

TBD

### ## Related Documents

```
<!-- AI_HINT: PENDING_DISCOVERY - DO NOT AUTOFILL -->
```

TBD

Allowed ADR Status values:

- Proposed
- Accepted
- Superseded
- Deprecated

---

## **governance/risks.md**

Create:

| ID  | Risk | Impact | Mitigation | Status |
|-----|------|--------|------------|--------|
| TBD | TBD  | TBD    | TBD        | TBD    |

---

## **governance/assumptions.md**

Create:

| ID  | Assumption | Validation Method | Status |
|-----|------------|-------------------|--------|
| TBD | TBD        | TBD               | TBD    |

## **governance/open-questions.md**

Create:

| ID  | Question | Owner | Impacted Documents | Status | Resolution |
|-----|----------|-------|--------------------|--------|------------|
| TBD | TBD      | TBD   | TBD                | OPEN   | TBD        |

Allowed statuses:

- OPEN
- RESEARCHING
- RESOLVED

## **glossary.md**

Create:

```
# Glossary

## Document Status

Draft

## Purpose

Define the authoritative vocabulary used across the repository.

## Usage Rule

Terms should be defined here before broad usage elsewhere.

Other documents should reference the glossary rather than redefine terms.

## Terms

| Term | Definition | Notes |
```

```
|-----|-----|-----|
| TBD | TBD | TBD |
```

---

## archive/README.md

Create an archive log document.

Purpose:

Track archived documents and their replacements.

Create table:

| Date Archived | Archived File | Reason | Replacement |
|---------------|---------------|--------|-------------|
| TBD           | TBD           | TBD    | TBD         |

---

## ai-doc-linter.yml

Create the file only.

Add comments explaining it is a future placeholder for documentation validation workflows.

Do not implement workflow logic.

---

## Output Requirements

Create all directories.

Create all markdown files.

Populate every file with the requested structure.

Do not generate architecture.

Do not generate requirements.

Do not generate actors.

Do not generate technologies.

Do not generate integrations.

Do not generate business rules.

Do not generate implementation details.

The deliverable is a clean, maintainable architecture repository scaffold ready for future architecture population.
